Police Recorded Injury Road Traffic Collisions and Casualties in Northern Ireland: Monthly Update to 30th September 2015

Published 27th November 2015

This bulletin presents the most recent injury road traffic casualty statistics relating to collisions recorded by the police for the period 1st January to the 30th September 2015 based on figures that were compiled on 23rd November 2015. Any figures recorded from 1st April 2015 are provisional and will be subject to change until the finalised statistics are published in March 2016.

Daily update of road death statistics

As part of our commitment to provide users with more timely information, we publish a provisional daily count of road traffic deaths occurring on Northern Ireland's roads giving information of the location, age and gender of each road traffic fatality. This is updated each working day on the [PSNI Website](#); click the link to access the [Daily Fatal Report](#).

Data quality

The PSNI's statistics on injury road traffic collisions are sourced from PSNI systems that are used to record incidents reported to the police and to manage any subsequent investigations. As such, the statistics are derived from an administrative dataset and we therefore have to apply a variety of checks to ensure that the statistics we report are accurate and reliable. Over the years the PSNI's Statistics Branch has worked closely with PSNI colleagues in designing systems and processes for recording injury RTC statistics to maximise data quality. These include:

- Having a direct link from the PSNI's Command & Control system to the NICHE records management system, allowing us to ensure that details of all injury collisions are received.
- Having a series of status codes established to enable us to identify at which stage in the process each injury RTC incident is at any given time. This ensures that RTC incidents aren't lost or overlooked during the process.
- We have a variety of internal data validation checks that we undertake throughout the year to improve data quality.
- We check the geo-coordinates of all collisions to ensure that there aren't any recorded in the incorrect location.
- We cross reference PSNI RTC fatalities with those recorded by the Coroner's office to check that they match and that we haven't missed any subsequent deaths.

More details of the processes and checks that we have in place can be accessed from the [Traffic Statistics User Guide](#) and the [Quality Report](#), all of which are available on our [website](#).

National Statistics

The United Kingdom Statistics Authority has designated these statistics as National Statistics, in accordance with the Statistics and Registration Service Act 2007 and signifying compliance with the Code of Practice for Official Statistics. Designation can be broadly interpreted to mean that the statistics:

- *meet identified user needs;*
- *are well explained and readily accessible;*
- *are produced according to sound methods; and*
- *are managed impartially and objectively in the public interest.*

Once statistics have been designated as National Statistics it is a statutory requirement that the Code of Practice shall continue to be observed.

Road Traffic Collision Statistics – January to September 2015

Monthly Trends

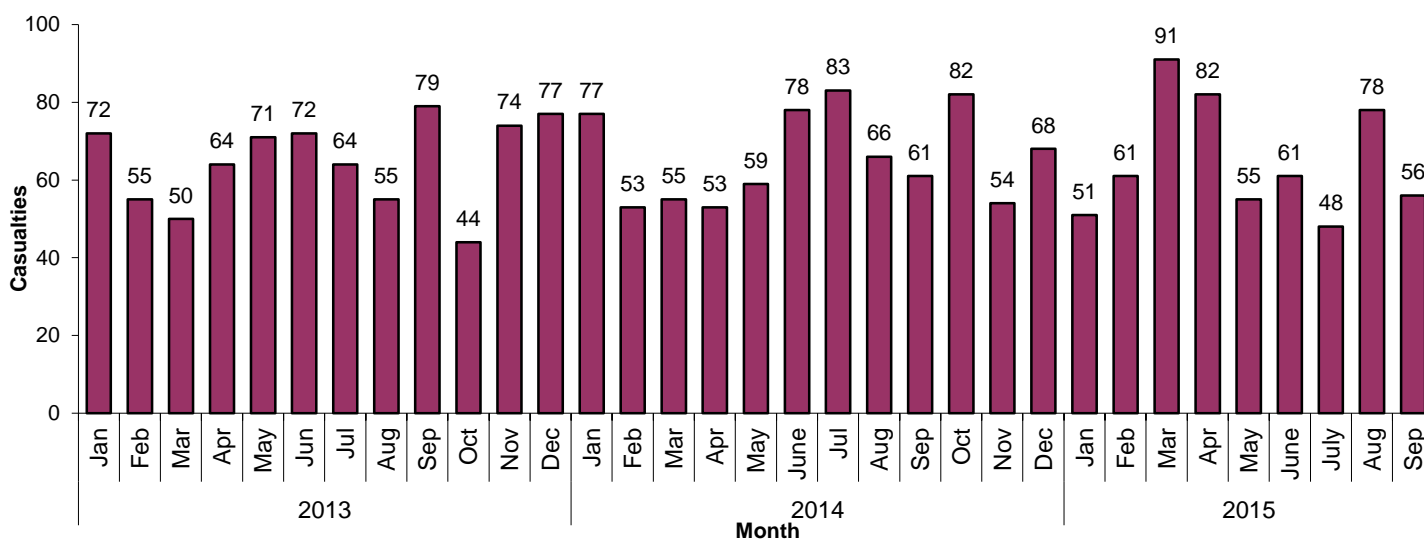

- There were 4,400 collisions recorded between January and September 2015 resulting in a total of 7,003 casualties. This is comprised of 55 fatalities, 528 people seriously injured and a further 6,420 people slightly injured. For the same time period last year there were 4,379 collisions of which there were 6,768 casualties comprised of 61 fatalities, 524 people seriously injured and 6,183 people slightly injured.
- There were 21 more collisions reported between January and September 2015 in comparison with the same time period in 2014 and 235 more casualties recorded comprising 4 more people seriously injured and 237 more people slightly injured. However, there were 6 fewer deaths recorded during this nine month period in comparison with last year.
- The 56 people killed or seriously injured in September 2015 is 5 fewer than that of September 2014 and 22 fewer than the previous calendar month of August 2015.

Table 1 Police recorded road traffic casualties by injury severity and month: January to September 2015 compared with January to September 2014

Figure 1: Casualties killed or seriously injured in road traffic collisions by month: January 2013 to September 2015

Casualty Class

Figure 2: Casualties killed or seriously injured by road user type: January to September 2015

- There has been an overall reduction in the number of casualties amongst vulnerable road users (pedestrians, motorcyclists and pedal cyclists) with pedal cycle casualties reducing by over a quarter (25.6%) in comparison with last year. In terms of those killed and seriously injured vulnerable road users decreased by 41 when comparing January to September 2015 with the same time period last year with pedestrian KSI casualties reducing by 2, motorcyclists by 19 and pedal cyclists by 20.
- In contrast, there has been an increase in the number of drivers and passengers killed or seriously injured with 7 more driver and 30 more passenger KSI casualties recorded between January and September 2015 in comparison with the same time period last year.

Figure 3: Difference in the number of KSI casualties by road user type: January to September 2015 compared with January to September 2014

Table 2 Number of police recorded road traffic casualties by road user type: January to September 2015 compared with January to September 2014

	01 January – 30 September 2014					01 January – 30 September 2015*				
	Killed	Seriously injured	KSI ¹	Slightly injured	Total	Killed	Seriously injured	KSI ¹	Slightly injured	Total
Pedestrians	14	104	118	446	564	11	105	116	435	551
Drivers of motor vehicles	22	182	204	3,379	3,583	23	188	211	3,592	3,803

Killed or seriously injured * Figures are provisional and subject to change

Age and gender

- All age groups increased the number of casualties recorded between January and September 2015 in comparison with last year with the largest increase in overall casualties being from the 35 to 49 age group which rose by 69 casualties.
- There has been a decrease in the number of KSI casualties recorded among vulnerable age groups. Children (under 16), young people (16 to 24) and older people (aged 65 plus) have fallen by 4, 6 and 5 respectively this period from the number recorded to the end of September last year.
- While males comprise approximately three fifths of those killed or seriously injured, there were 31 fewer male KSI casualties recorded between January and September 2015 than the same time period last year (falling by 7.9%). In contrast, there were 29 more females killed or seriously injured during this nine month period than the same time period last year.
- More males were killed or seriously injured in each age group during this period with the exception of those aged 65 and over. Females accounted for 48 out of the 71 KSI casualties recorded amongst older people so far this year (67.6%).

Northern Ireland Total	61	524	585	6,183	6,768	55	528	583	6,420	7,003

^{#1} Killed or seriously injured * Figures are provisional and subject to change

- Armagh City, Banbridge & Craigavon and Mid Ulster Districts had the highest number of road deaths recorded between January and September 2015 with seven. The Mid Ulster District also had the largest increase in KSI casualties compared with last year with 18 more recorded during this nine month period.
- The District with the highest number of people seriously injured recorded between January and September 2015 was Belfast City with 84.
- Lisburn and Castlereagh City District had the highest increase in overall casualties increasing by 120 from 563 recorded between January and September 2014 to 683 this period.

Figure 4: Casualties killed or seriously injured by District: January to September 2015 compared with January to September 2014

Principal causation factors

Table 5: Most common principal causation factors of those killed or seriously injured in road traffic collisions: January to September 2015

Principal Factor	Total KSI casualties
Inattention or attention diverted	61
Excessive speed having regard to conditions	56
Alcohol/drugs driver rider	56
Wrong course/position	49
Turning right without care	34
Heedless of traffic crossing carriageway	30
Overtaking on offside without care	29
Emerging from minor road without care	27
Other driver/rider factor	24
Crossing or entering road junction without care	23

- The most common principal causation factors for KSI casualties between January and September were 'Inattention or attention diverted (61 KSI casualties), followed by 'Excessive speed having regard to conditions' and 'Impaired by alcohol/drugs – driver/rider' (both with 56 KSI casualties).

Single vehicle collisions

Table 6 Casualties resulting from single vehicle collisions¹ by injury severity and month: January to September 2015 compared with January to September 2014

	01 January – 30 September 2014					01 January – 30 September 2015*				
	Killed	Seriously injured	KSI ¹	Slightly injured	Total	Killed	Seriously injured	KSI ¹	Slightly injured	Total
January	1	10	11	99	110	1	8	9	94	103
February	0	7	7	85	92	0	16	16	97	113
March	3	15	18	96	114	2	19	21	81	102
April	1	7	8	57	65	2	12	14	76	90
May	1	20	21	88	109	1	14	15	58	73
June	2	13	15	105	120	4	19	23	96	119
July	1	18	19	83	102	1	8	9	95	104
August	2	15	17	86	103	1	14	15	85	100
September	2	12	14	60	74	5	11	16	83	99
Total	13	117	130	759	889	17	121	138	765	903

¹ Defined as a collision which involves no other party other than the vehicle itself * Figures are provisional and subject to change

- There were 683 single vehicle collisions recorded between January and September 2015 which accounts for 15.5% of the total number of collisions recorded.
- There were 138 people killed or seriously injured as a result of a single vehicle collision between January and September 2015 which is eight more than the 130 recorded in the same period last year.
- Most single vehicle collisions so far in 2015 have occurred in June with 119 casualties of which 23 have been either killed or seriously injured.

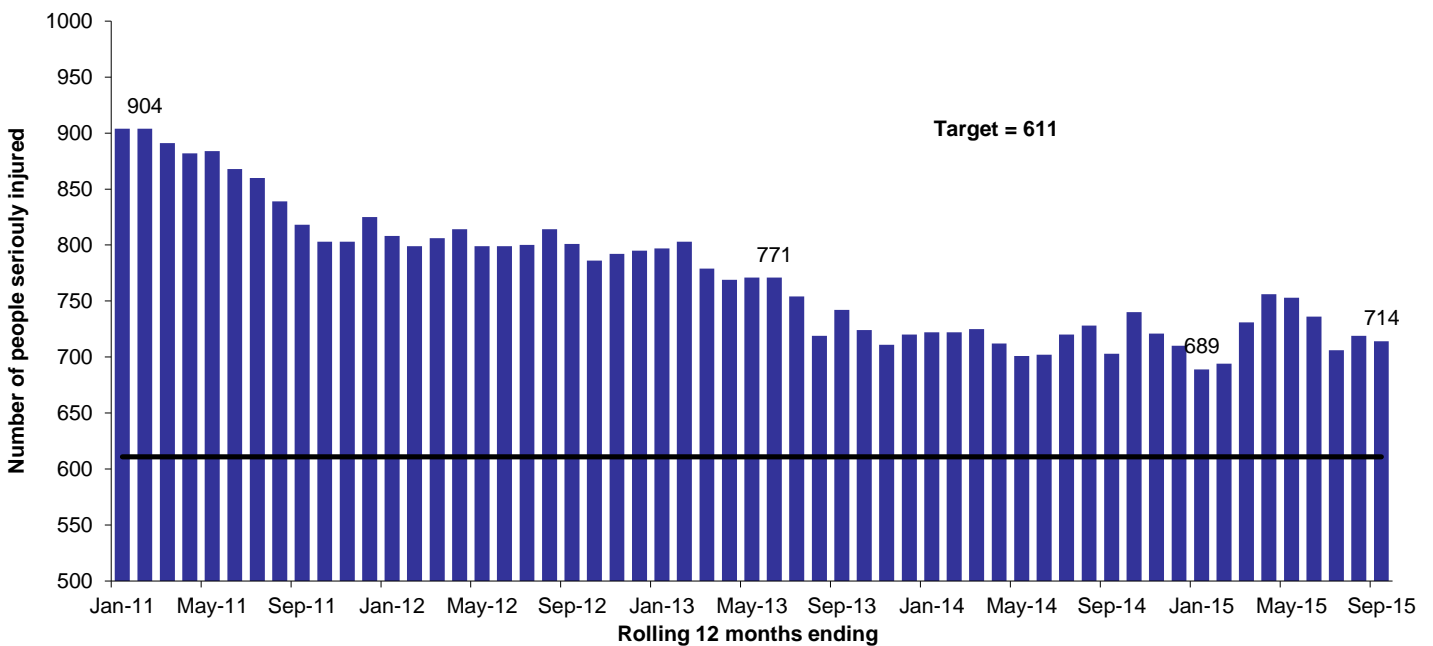

Casualty reduction target for 2020

Figure 5: Number of people killed on Northern Ireland's Roads – Rolling 12 months January 2011 to September 2015

- The Department of Environment's Northern Ireland Road Safety Strategy aims at a 60% reduction on the number of fatalities on Northern Ireland's roads each year, from the 2004 – 2008 average of 126 to fewer than 50 by 2020. Although, this figure has dipped below this target achieving 45 for the 12 month period ending October 2012, the current figure of 73 for the period 1st October 2014 to 30th September 2015 is 23 deaths above the target.

Figure 6: Number of people seriously injured on Northern Ireland's Roads – Rolling 12 months January 2011 to September 2015

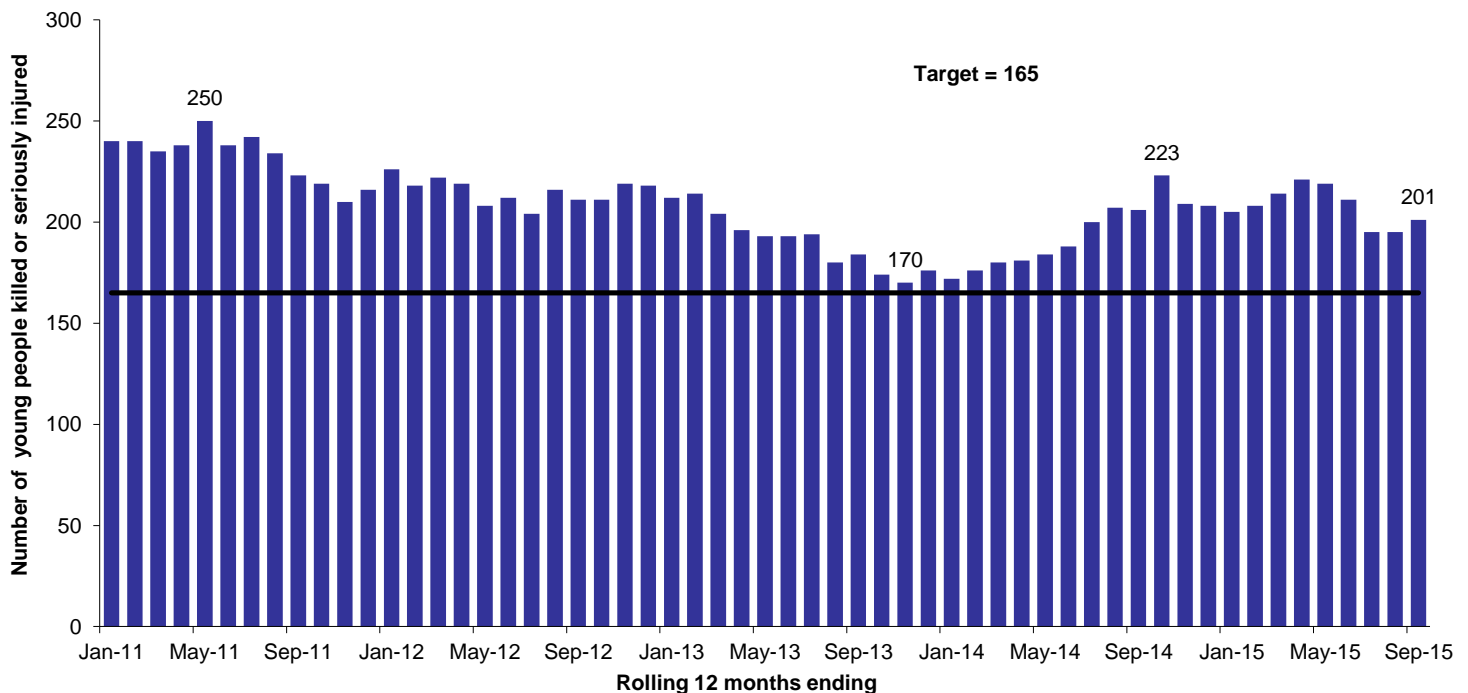

- The Department of Environment's Northern Ireland Road Safety Strategy also aims at a 45% reduction in the number of persons seriously injured on Northern Ireland's roads each year, from the 2004 – 2008 average of 1,111 to fewer than 611 by 2020. The current rolling 12 month figure covering 1st October 2014 to 30th September 2015 provisionally sits at 714, more than 100 above the target.

Figure 7: Number of children killed or seriously injured on Northern Ireland's Roads – Rolling 12 months January 2011 to September 2015

- The Road Safety Strategy has set a target of 55% reduction in the number of children killed or seriously injured on Northern Ireland's roads each year, from the 2004 – 2008 average of 128 to fewer than 58 by 2020. Although this was achieved in July 2015 with 53, the current figure covering the period 1st October 2014 to 30th September 2015 is 12 more than this at 65 and provisionally sits seven more than the target.

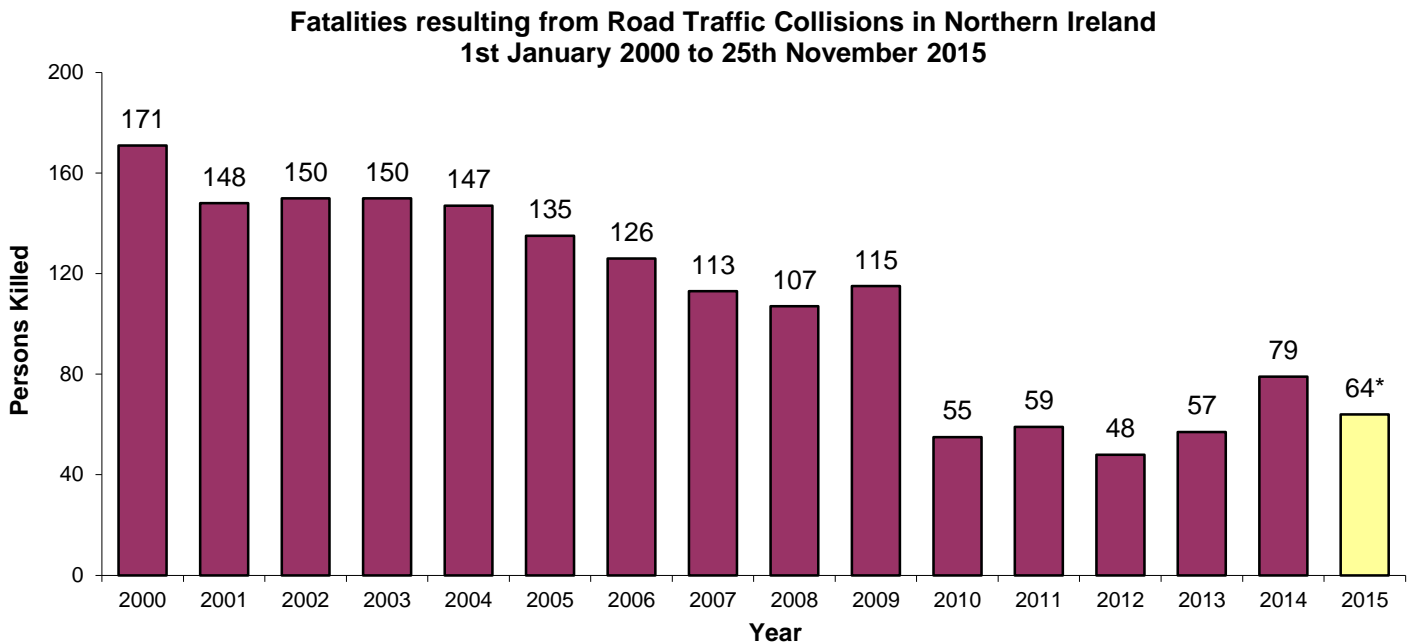

Figure 8: Number of young people (16-24) killed or seriously injured on Northern Ireland's Roads – Rolling 12 months January 2011 to September 2015

- The Strategy also has a target of a 55% reduction in the number of young people (16-24) killed or seriously injured on Northern Ireland's roads each year, from the 2004 – 2008 average of 366 to fewer than 165 by 2020. The lowest rolling 12 month figure recorded for this target was 170 for the period ending November 2013, only 5 above this target, however the current figure to the end of September 2015 provisionally sits at 201.

Fatalities

Figure 9: Number of people killed on Northern Ireland's roads – 2000 to 2015*

* Provisional fatality figure up to the 25th November 2015

- The number of people killed in road traffic collisions in the years up to and including 2009 was consistently above 100 and then in 2010, there was an unprecedented reduction in which fatalities fell to 55 (a reduction of 52%). This figure has fluctuated around this level until increasing to 79 deaths in 2014 (up 38.6% from 2013). In 2015 to the 25th November there have been 64 people killed which is nine less than the same period in 2014.
- Of the 64 road deaths occurring so far in 2015, 34 (53.1%) occurred on rural roads (defined as where the speed limit is over 40 miles per hour excluding motorways and dual carriageways) while 19 occurred on urban roads (40 miles per hour or less) and 11 occurred on motorways or dual carriageways. The [Daily Fatal Report](#) on the [PSNI website](#) provides more information.

Notes

Strengths and Limitations of the data

Strengths

The purpose of collating and reporting on injury road traffic collisions is to provide accurate and timely management information to the PSNI to assist them with tracking trends, identifying problem areas and in developing policies related to road policing issues. Police recorded injury road traffic collision and casualty statistics are used by a variety of organisations and individuals in the public and private sector as well as by the wider general public.

PSNI Statisticians attend the Standing Committee on Accident Statistics (SCRAS) and this gives a UK-wide focus to our work. We work closely with the Department for Transport to ensure that our work is comparable with other regions of the UK.

The Department of the Environment for Northern Ireland uses the PSNI's injury road traffic statistics to inform policy and monitor performance in relation to various road safety strategies. Similarly, the statistics are key to informing colleagues in the Department for Regional Development's Road Service in relation to identifying the location and causes of collisions so that they can assess whether a road engineering solution is required.

The statistics are also used to inform the [Northern Ireland Road Safety Partnership](#) on the need for cameras to enforce identified roads which are prone to injury road traffic collisions due to speeding or road junctions where collisions result from drivers ignoring the mechanical traffic signals (red light running). The statistics are widely referred to in the media and are used by those individuals or organisations with an interest in road safety.

Limitations

Comparison of road accident reports with death registrations shows that very few if any road accident fatalities are not reported to the police. However, it has long been known in GB (and by extension in NI) that a considerable proportion of non-fatal casualties are not known to the police, as hospital, survey and compensation claims data all indicate a higher number of casualties than suggested by police accident data.

The data used as the basis for these statistics are therefore not a complete record of all personal injury road accidents, and this should be kept in mind when using and analysing the figures. However, police data on road accidents (STATS 19), whilst not perfect, remain the most detailed, complete and reliable single source of information on road casualties, in particular for monitoring trends over time.

One of the main limitations of police recorded injury road traffic collision statistics, as mentioned above, is the extent to which they represent the true level of injury road traffic collisions and casualties that occur within the UK. Extensive research has been conducted within GB in order to get an estimate of the level of this under-reporting. The research has generally focused on 2 sources of comparable information, (i) hospital admissions data¹ and (ii) survey data from The Travel Survey for Northern Ireland².

¹ Reported Road Casualties in Great Britain Annual Report 2011: Department for Transport
<https://www.gov.uk/government/statistics/reported-road-casualties-great-britain-annual-report-2011>

² The Travel Survey for Northern Ireland 2012-2014
<https://www.drdni.gov.uk/publications/travel-survey-northern-ireland-tsnj-headline-report-2012-2014>

While both comparisons would indicate that police recorded injury collision statistics are less complete than other sources, there are many reasons why this may be the case. For example, the police recorded statistics only relate to collisions that take place on the public roads and exclude collisions that occur on private land or public parks etc. Similarly, persons injured in certain types of collisions may be less likely to report these to the police e.g. casualties resulting from collisions where no motor vehicle is involved (cyclists falling off their bikes or colliding with pedestrians).

In Northern Ireland, police recorded fatal and serious injury collision casualties (KSI's) for 2014/15 equate to approximately 61% of the comparable figures on road casualties obtained from hospital admission statistics over the same period, up from 57% in the previous year.

The Travel Survey for Northern Ireland indicates that 68% of persons involved in at least one road accident in which there was an injury made police aware of the collision, either by attending at the scene or reporting afterwards. (The confidence interval around this was +/- 8%).

The Department of Regional Development produce the Travel Survey for Northern Ireland which collects information on how and why people travel within Northern Ireland. The survey uses three years of data to ensure the analysis is robust.

Revisions

Revisions are carried out in accordance with our Revisions Policy, a copy of which is available in the Official Statistics section of the PSNI Statistics website. Figures published within a current financial year to date are provisional and will be subject to slight revision until figures for the full financial year are published. These amendments can happen for a number of reasons, such as a collision being included or excluded following further investigation by an officer.

Comparing this monthly bulletin with the previous one, published 23rd October 2015, the following revisions have been made:

Police recorded road traffic collision casualty figures by month						
		Collisions	Casualties

Comparisons with Great Britain

Results from the most recent period covered by the Department for Transport statistical releases (published 5th November 2015) refer to the rolling 12 month period ending June 2015. Key points from the publication are as below:

- Road deaths decreased by 2% compared to the year ending June 2014, to 1,700
- There were 22,830 killed or seriously injured (KSI) casualties, a 7% decrease compared with the previous year.
- There were 180,500 reported road casualties of all severities, 7% lower than the year ending June 2014.
- Between April and June 2015:
 - There were 400 road deaths, a 7% decrease from the same quarter in 2014
 - KSI casualties decreased by 11% with slightly injured casualties and overall total casualties both falling by 12% compared with the same quarter in 2014.

Additional Data

More detailed statistical tables on injury road traffic collisions in Northern Ireland are available on the Police Recorded Injury Road Traffic Statistics section of the PSNI website.

Further Information

Further information is available in the [Police Recorded Injury Road Traffic Collision Statistics Northern Ireland User Guide](#) on the [PSNI website](#).

Also note that PSNI Statistics Branch will publish more detailed 2015 annual reports in March and June 2016. These reports will provide detailed information on casualties, causation, location, conditions and comparisons with other areas. If you have anything that you would like to see included in these reports, please feel free to contact us, details are provided on the cover page.

Recorded road traffic collision and casualty definitions

Collisions: Collisions involving personal injury occurring on the public highway (including footpaths) in which a vehicle is involved. Collisions are categorised as either 'Fatal', 'Serious' or 'Slight' according to the most severely injured casualty.

Killed: Died within 30 days from injuries received in a collision.

Serious Injury: An injury for which a person is detained in hospital as an 'in-patient', or any of the following injuries whether or not the person is detained in hospital: fractures, concussion, internal injuries, crushings, burns, severe cuts and lacerations or severe general shock requiring medical treatment.

KSI: Refers to collisions or casualties where someone was killed or seriously injured.

Slight Injury: An injury of a minor character such as a sprain, bruise or cut not judged to be severe, or slight shock requiring roadside attention.

Casualty: A person who sustains a slight, serious or fatal injury.

Children: Persons under 16 years of age.

Vehicles Involved: Vehicles whose occupants are injured, vehicles suffering damage, vehicles that contribute to the collision, and horses being ridden at the time of the collision. Vehicles that collide after the initial impact causing injury are not included unless they aggravate the degree of injury or lead to further casualties.

Drivers of motor vehicles: Drivers of hackneys, cars, motor caravans, LGVs, HGVs, cars used as taxis, minibuses and buses

Motorcyclists: Drivers/riders of mopeds and motorcycles. Includes riders of two-wheeled motor vehicles, motorcycle combinations, scooters and mopeds.

Pedal cyclists: Drivers/riders of pedal cycles. Includes children riding toy cycles on the carriageway and the first rider of a tandem.

Passengers: Occupants of vehicles other than the driver or rider. Passengers of hackneys, cars, motor caravans, LGVs, HGVs, cars used as taxis, minibuses, buses and pedal cycles.

Pillion passengers: Passenger on a moped or motorcycle.

Other road users: Drivers and passengers of invalid / 3 wheelers, tractors, ridden horses, other motor vehicles and other non-motor vehicles.

Pedestrians: Include

- Children on scooters, roller skates or skateboards;
- Children riding toy cycles on the footpath;
- Persons pushing bicycles or other vehicles or operating pedestrian-controlled vehicles;
- Persons leading or herding animals;
- Occupants of prams or wheelchairs;
- People who alight safely from vehicles and are subsequently injured;
- Persons pushing or pulling a vehicle;
- Persons other than cyclists holding on to the back of a moving vehicle
